

Coding Challenge

◆ Level 1: Placement Thinking

1. Number Guessing Game

- Store a secret number (e.g., 7)
- Ask user to guess
- If guess is:
 - Low → print "Too Low"
 - High → print "Too High"
 - Correct → "You Won!" and stop

Concept: infinite while + if

2. Reverse a Number

Input: 1234

Output: 4321

Use while loop

3. Count Digits in Number

Input: 56789

Output: 5

Hint: keep dividing by 10

◆ Level 2: Real-World Scenario (Data Analyst Thinking)

4. Sales Threshold Checker

You have sales values:

sales = [1200, 800, 1500, 400, 2000]

Task:

- Print only sales greater than 1000
- Count how many such sales exist

Concept: loop + condition filtering (real analytics logic)

2. Continuous Data Entry System

Keep asking user to enter numbers:

- Stop only when user enters 0
- Print total sum

This is how real systems collect streaming data
